

Content of the report

This report will later be the basis of the final dissertation document, which you will turn in in June, so you should use the template provided on Moodle for the Thesis/State of the Art right now.

The document should contain:

An introduction chapter, with the contextualization of the topic, identification of the problem, and research questions;

A chapter that corresponds to the state of the art. This should present related work in order to show what exists in the same field as the thesis and what problems have been encountered;

make clear that there is an opportunity for the contribution that covers some concrete gap;

contain a technological review of the main tools that can be used in the scope of the project (if applicable), justifying future choices;

be strongly supported by references, with a particular focus on scientific references whenever possible - journal and conference papers, books - and less on websites;

A work plan chapter for the following months, identifying the main tasks clearly (do not use generic task names such as "development"), with a short description paragraph, and a schedule, which should be illustrated in a Gantt diagram or similar;

Bibliography.

Report due (by Feb. 12):

The report's due date is February 12, to allow for some improvements to be made after feedback is received on the presentations.

The report should be delivered in PDF format on Moodle, in a link that will be made available for this purpose, and sent by the student at the same time to the advisor(s), who will be asked later for an opinion about it.

For reference, the evaluation topics will be as follows (scale of 1 to 5):

Problem definition. (1 - Very vague; 5 - Well defined);

State of the art (1 - Very incomplete; 5 - Very thorough);

Prospects for solution (1 - Undefined; 5 - Well identified);

Writing quality (1 - Very poor; 5 - Very good);

General assessment of work (1 - Very late; 5 - Advanced)
