

LayerIt! — Form & Mechanical Corrections

All form-level fixes: English errors, typos, consistency, and mechanical standardization. Content and structural changes are covered separately.

1. Figures from the literature (*highest priority*)

Whenever using figures from published papers, first verify the publication licence (e.g. CC BY, CC BY-NC, IEEE, Springer, etc.).

There are three possible cases:

1. **Reproduced figure** (copied from the original paper).

Caption example:

Figure X. Reproduced from Jung et al. [XX] under CC BY 4.0.

2. **Recreated figure** (generated with LayerIt to reproduce the same visualization concept).

Caption example:

Figure X. Recreation of the visualization presented by Jung et al. [XX], generated with LayerIt.

3. **New figure inspired by prior work** (different example illustrating the same concept).

Caption example:

Figure X. Score-aligned visualization generated with LayerIt, illustrating the visualization concept discussed by Jung et al. [XX].

Whenever a figure is reproduced, explicitly state the licence (or “Reproduced with permission”) in the caption.

2. General proofreading

Perform one complete proofreading pass over the dissertation.

The English is generally good, but there are many small issues throughout:

- missing articles (“a”, “an”, “the”)
- missing commas
- incorrect prepositions
- subject-verb agreement
- inconsistent punctuation
- overly long sentences

Reduce conversational language. Avoid expressions such as:

- we'll

- we'll explore
- we'll present
- good example

Prefer formal academic English throughout.

British English

Adopt **British English** consistently throughout the dissertation.

Examples include:

- analyse (not analyze)
- visualisation (not visualization), except where part of the official name of software or a verbatim quotation
- modelling (not modeling)
- licence (noun) / license (verb)
- different **from** (not different **than**)

3. Broken or malformed sentences

- **Abstract — doubled acronym.**

Python-based object-oriented (Object-Oriented (OO)) framework → Python-based object-oriented (OO) framework

- **§1.2 — stray period splitting a sentence.**

...libraries and tools namely: librosa, matplotlib, modusa, BeatThis, and ScoreWarp. into a unified, modular framework. → ...libraries and tools, namely librosa, matplotlib, modusa, BeatThis, and ScoreWarp, into a unified, modular framework.

- **§1.1 — missing space after colon.**

musical data comes in a variety of forms:from audio recordings → ...forms:
from audio recordings

- **§1.1 — comma splitting subject from verb.**

the how and what is visualized, shapes the conclusions we draw → the how and what is visualized shapes the conclusions we draw

- **§2.3 — duplicated phrase.**

Online alignment (also known as also known as score following) → Online alignment (also known as score following)

- **§3.3.1 — missing comma / article.**

integrates BeatThis the as-of-now SOTA BT algorithm → integrates BeatThis, the current SOTA BT algorithm

- **§3.3.2 — zeros instead of “OO”.**

Python Based OO tool → Python-based OO tool

4. Spelling & typos

Find	Replace	Location
continuos	continuous	§2.1.2
doted	dotted	Fig. 4.2 caption + List of Figures entry
These ar mostly produced	These are mostly produced	§3.1
alining scores	aligning scores	§3.1
a give note	a given note	§2.1.2

5. Consistency & terminology

Naming consistency

- Use LayerIt or LayerIt! consistently throughout.
- Use canonical library names consistently:
 - librosa
 - matplotlib
 - madmom
 - modusa
- Use Sonic Visualiser consistently (except inside verbatim quotations).
- Capitalize proper names consistently (e.g. Verovio, ASAP dataset).

Acronyms

- Define each acronym only once.
- Use a consistent style throughout (BT, BA, MIR, SVG, OO, GUI, etc.).

Hyphenation

Standardize expressions such as:

- time-aligned
- score-aligned
- code-based
- GUI-based
- Python-based
- object-oriented

- machine-readable
- human-readable
- state-of-the-art
- frame-by-frame

Terminology

Use terminology already established in the MIR literature wherever possible. Avoid introducing new terms unless they are clearly justified and explicitly defined.

6. Factual corrections (small, in-place)

- §2.1.2 — chromagram pitch-class count.

a plot divided into 11 lines, each representing a give note → a plot divided into 12 lines, each representing a given note

7. Voice consistency

The dissertation is written in the first-person plural throughout.

Replace isolated first-person singular usages.

Example:

- §2.1.2

Next I'll introduce the Constant-Q Transform → Next we introduce the Constant-Q Transform

Perform a quick sweep for any remaining I, I'll, my, etc.

8. Typography & formatting

Perform one consistency pass over:

- quotation marks
 - list punctuation (either all bullets end with a period or none do)
 - figure captions
 - table captions
 - monospace formatting for code, filenames and function names
 - spacing around parentheses and abbreviations
 - nested parentheses where possible
-

9. References

Perform one complete consistency pass over the bibliography.

Entries of the same type should contain the same level of detail (venue, year, DOI, URL, access date, etc.).

Complete the missing bibliographic information for:

- [2] Carabias-Orti et al.
- [7] Khodzhaev
- [11] Nakamura et al.
- [15] Valle

Add any additional references cited in the new Evaluation chapter.

Note — please check my comments on the following three sections before applying these edits:

10. MEI attribute standardization — don't think we need to give many details about this in the dissertation.

11. Chronology — same for this: this is a dissertation, not a report; when we did something or how much time it took is not relevant.

12. Listings & code — except for cases where a short snippet of code is highly expressive, e.g. showing that composing a complex figure takes only 4 lines of code.

10. MEI attribute standardization

Replace `@xml.id` with the correct `@xml:id` notation throughout §4 (the correct form already appears once in §2.1.2). This is a minor, mechanical fix and does not need further elaboration in the dissertation text.

11. Chronology

The iteration dates in §3.2.3 (BeatPrecision) and §3.2.4 (Score-Alignment.py) are internally inconsistent — both should read 2026, not 2025. As this is a dissertation rather than a progress report, the precise timeline carries little weight on its own and does not need further discussion beyond this correction.

12. Listings & code

Code and listings should be kept to a minimum in the main body. Full listings belong in a dedicated **Annex**; retain inline code in the main text only where a short snippet is highly expressive — for example, showing that composing a complex figure requires only four lines of code.

- **§4.3.3 — wrong listing reference.**

The next listing (4.5)... → The next listing (4.4)...

Once listings are relocated to the Annex, audit and renumber all in-text cross-references accordingly.

- **§4.3.3 — variable naming.**

Listing 4.5 mixes

- SVG_Layer1
- SVGLayer1_withScore
- SVG_Layer1_withScore

Choose one convention and apply it consistently.
